

Executive Summary

This is an attempt to determine how theories may be used in the real world. As a master's student in business administration, everyone is required to do a summer project at a reputable institute or institution as part of their studies. As a result, I received the opportunity to participate in summer training at CDTI Bangalore for this aim.

My internship project report “A Study on Cost and Profitability Analysis at CDTI Pvt Ltd”. Before the internship, I had a lot of questions regarding how an organization deals with regards to finance. Through this internship it helped me clear all those questions and doubts.

CTDI is a full-service, global engineering, maintenance, and logistics company that specializes in providing low-cost communication solutions. CTDI, as a global leader, offers a wide variety of services and equipment to the world's major telecom and cable service providers, as well as significant OEMs.

The CTDI Corporate Procurement section is in charge of negotiating and contracting for CTDI Production areas' products and services. The supply chain is recognised as a strategic strength of our organization, and CTDI is always striving to improve process performance and minimize costs. Improvements might take the shape of logistical, process, and material standardization, as well as volume discounts for cost savings.

Cost analysis is an important that the usage of this analysis is very wide. Profitability is a sort of income statement analysis done by analysts to determine how appealing a company's economics are. The research about the cost and profitability analysis of the CTDI covers the cost analysis and the profitability ratio of five years to present. This study states the financial position of the company.
