### **ABSTRACT**

Agriculture is a word widely associated with rural living but the urban life also depends on it. Urban cities shouldn't only be responsible for the consumption but can take part in the production, distribution and education as well.

Over more than decades the increase in pollution and development made in farming technology has increased the call for livestock and crops from agriculture industry. The growth in the agriculture production has derive in increase in contaminated polluting soil and waterways.

As the pollution increases agriculture effects a lot leads to extinct of food.

To avoid it from the extinction and in a degrade level this project will help the society to rise the income of government, to rise the awareness of agriculture, to reduce the polluted food, to increase training of future farmers.
