ABSTRACT

In today's world of increased environment awareness, a fishing port must be planned , designed and managed in harmony with both the physical and biological coastal environment.

Fishing ports and fishing landing sites area complex interface zones involving the mixing of environment , ecological, economic and social activities and problem. This mix of activities demands strong cross-sector interaction at the planning stage to ensure that the resulting infrastructure may be managed in a sustainable manner.

So what I intent to do is to organize the areas properly which are presently scattered and established fish port, market, ice plant and cold storage and other supportive facilities necessary for the efficient handling and distribution of fish And fisher products. To help improved the income of small fishermans through the provision of services facilities and this will add to the value of their way of living and also attract more tourist which will serve as the income for the port during the fishes breeding swasons. The main aim of the project is to design and create a fishing port with recreational space keeping in mind the comfort and needs of the employees and common people. A port, with the most, advanced facilities and features to satisfy all the need of employees, customs and tourists

ACKNOWLEDGEMENT

I would like to convey my sincere and unfeigned regards towards all those who have aided me in this venture. Without their support, criticism, help and nurture I would not have paved this path of journey in architecture.

I am obliged to the institute for giving me this opportunity to take forward a study based on enhancing the acquaintance with old Mangalore port. I am grateful to the thesis coordinator Prof. Ar. Neha and thesis guide Prof. Ar. Pavithra and all other faculties and staff for their invaluable support, guidance, help and patience at each pace of this project till its completion.
